

SEAGRASS BLUE

Scaling seagrass meadows to remove carbon
and increase ocean biodiversity

One hectare of seagrass removes
30 times more CO₂
than a hectare of Amazon rainforest

But restoring seagrass is hard...

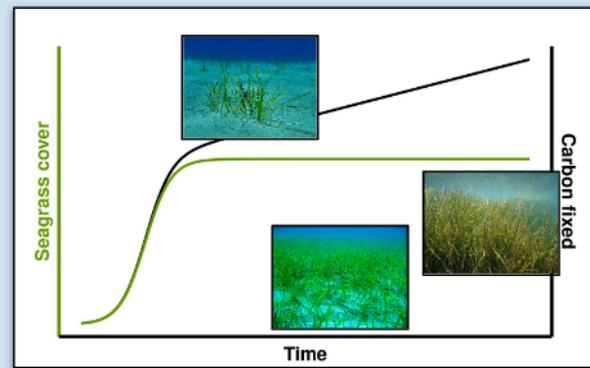

Our Solution

Aquaculture of **seagrass meadows** in modular mid-water Farm Pods

Robotic monitoring of seagrass growth, carbon capture, and biodiversity

Carbon removal and biodiversity increases that are **verifiable and transparent**

Seagrass Blue

Chris Lewis

**The engineer
and entrepreneur**

Dr Craig Syms

**The marine scientist
and biostatistician**

Lana Cranga

**The commercial
sales expert**

The challenges...

- Seagrass has never been grown in open-water aquaculture before
- Need: Real-world demonstration of proof of concept before scaling up to industrial scales
- Integrate robotic monitoring for carbon verification and biodiversity contribution

EMSO ERIC Physical access

- **OBSEA**: 20m depth, 4km offshore, with 4G coverage, protection from fishing
- **UPC staff** with background and expertise:
 - Equipment deployment
 - Seagrass cultivation in lab
- UPC **partnerships** with logistics and engineering companies

Tasks achieved and ongoing

Deployment

Planting

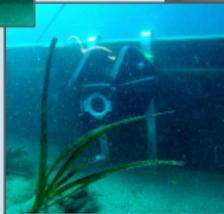

Robotics and sensor testing

The Seagrass Blue - EMSO ERIC link

Technical synergies

Ecological synergies

Collaborations and the future

- Further development of technology and engineering solutions to >TRL6
- Synergistic relationship with UPC and Obsea
Ocean sensing instrumentation
Seagrass restoration
- Key milestone in developing a scalable commercial solution to capture carbon and increase biodiversity

SEAGRASS BLUE

Save the planet, grow grass
